

Smartly Aligning all your Quality Initiative Reporting

Many quality measures are used in multiple reporting criteria - whether you are a single practice focused on MU or PCMH, or you are part of an ACO or HIE. The alignment of all these measures and criteria can be daunting. What if you could support all initiatives centrally for all participating providers, practices and groups? What if at the same time you could help support the ultimate goal of maximizing revenue for your members too?

PrecisionBI provides a unifying platform agnostic to your members' PM and EMR system selections. It **centralizes all your individual and group population health monitoring needs**. With PBI, you can immediately enable provider level, group level, system level and ACO or HIE-wide cross-practice analysis and reporting.

This is a requirement at the individual & ACO/HIE levels to secure maximum reimbursement.

PBI has developed the tools for conforming and aggregating metrics from disparate systems, allowing you a 360° view of your goals and establishing a true "**Single Source of Truth**." Get clear and reliable information describing your progress toward specific requirements (PQRS, NQF, state-specific, etc.) for acute, chronic and preventive care, as well as disease-specific measures like DM, CHF, HTN, IVD and COPD.

Our data experts will teach you how to define target populations, build or modify searches and reports specific to individual measures and combine them visually to meet specific tracking needs. All of this can be accomplished without duplication each time a measure is reused for another reporting requirement.

Using PBI's **nightly incremental update** process, web-enabled dashboards and KPI tools, you will see daily progress towards each measure. This allows you the ability to react to negative processes in a timely manner.

And PBI's extensive report scheduling and automation capabilities enable you to distribute details to staff via e-mail or print-style reports. PBI's built-in analysis tools are **designed for the non-technical user**. These tools shorten by hours, days or weeks, the time it takes a programmer to design, build and test a report that may or may not tell you what you need to know. Empower your team with direct contact to a centralized data warehouse - giving you the information you need to effectively perform daily tasks while supporting your PHM goals. **Unlock the power of your data.**
